NOVEL CYCLIC PRO-PERFUMES  
HAVING MODIFIABLE FRAGRANCE  
RAW MATERIAL ALCOHOL RELEASE RATES  
FIELD OF THE INVENTION

The present invention relates to cyclic pro-perfumes capable of releasing at least one fragrance raw material alcohol, preferably a tertiary fragrance raw material alcohol. The novel pro-perfumes of the present invention can be modified by the formulator to control the rate at which the fragrance raw material alcohol is released once the material is applied, for example, to human skin.

BACKGROUND OF THE INVENTION

Humans have applied scents and fragrances to their skin since antiquity. Originally these aesthetically pleasing materials were commonly isolated in raw form as resins, gums or essential oils from natural sources, *inter alia*, the bark, roots, leaves and fruit of indigenous plants. These resins, gums, and oils were directly applied to the body or diluted with water or other solvent, including in some cases, wine. With the advent of modern chemistry, individual components responsible for the odor properties of these resins, gums and oils were isolated and subsequently characterized. Modern perfumery involves the artful compounding of fragrance materials to achieve novel fragrance compositions having defined "characteristics".

Many modern fragrances are no longer derived from natural sources but are synthesized by modern chemical methods as highly pure fragrance raw materials (FRM). These FRM's are currently formulated to produce fine perfumes, colognes, eau de toilettes, after-shave lotions, and other personal fragrance compositions. Those skilled in the art of preparing these fragrance-containing compositions have categorized fragrances into three types based on their relative volatility; top, middle, and base notes.

Top, middle, and base notes each serve a different purpose in the blending of fragrances and when properly formulated produce a "balanced fragrance" composition. Based on volatility, these notes are described by those skilled in the art as: the base notes having the most long lasting aroma; the middle notes, have a

medium volatility; and the top notes are the most volatile. Key to successfully formulating a fragrance-containing composition is the precise balance between these three groups of materials producing a fragrance-containing composition that diffuses during its evaporation in a manner which has an aesthetic quality.

It has been the goal of those skilled in the art of perfumes and fragrances to provide aesthetically pleasant odor compositions wherein the initial top, middle, and base note balance is maintained for an extended period of time. Due to the uneven rate of evaporation of the components which comprise a fine perfume or fragrance, the initial fragrance may be quite different than the aroma perceived several hours later. This problem is solved in many different ways by the user. One method is to "load up" on the perfume initially and rely on the natural evaporation rate to diminish the fragrance to a suitable level several hours later when the desired effect is needed. Another method which is used is to continually renew the fragrance by reapplying small amounts of the perfume to the skin at short time intervals. Neither of these solutions is adequate to overcome the diminishing level of top and middle notes over time. In fact, base notes which are present over a protracted period by virtue of their low volatility, begin to accumulate with each "re-freshing" of perfume. After some time these base notes overwhelm the other fragrance notes and destroy the original fragrance balance.

However, despite these artful approaches and compensating for the physical properties of perfume ingredients, formulators have not been able to well control the rate at which fragrance raw materials, especially fragrance raw material alcohols, are released when applied, for example, on human skin, hair, etc. Therefore, there has been a long felt need for a means of releasing at least one fragrance raw material alcohol, preferably tertiary alcohols, at a controllable rate.

It has now been surprisingly discovered that the novel cyclic pro-perfumes, which are the subject matter of the present invention, can not only release fragrance raw material alcohols but can be modified to release said alcohols within a range of time desirable to the formulator. In addition, the cyclic pro-perfumes described herein are capable of delivering highly desirable tertiary alcohols.

#### SUMMARY OF THE INVENTION

The present invention meets the aforementioned needs in that it has been surprisingly discovered that certain cyclic pro-perfumes can be modified to release their fragrance raw material alcohols at variable rates after being exposed to an acid milieu *inter alia* human skin.

A first aspect of the present invention relates to cyclic pro-perfumes capable of releasing at least one fragrance raw material alcohol, said pro-perfumes having the formula:

#### DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to cyclic pro-perfumes capable of releasing at least one fragrance raw material alcohol. Surprisingly, the cyclic pro-perfumes of the present invention are capable of releasing in a controlled manner desirable tertiary

perfume raw material alcohols *inter alia* linalool, ethyllinalool, dihydromyrcenol, and tetrahydrolinalool.

The pro-perfumes of the present invention are essentially orthoesters. Orthoesters, in general, may be considered to be "acetals" of carboxylic acid esters which can be formed by the reaction of an ester with two equivalents of alcohol. Treatment of orthoesters with sufficient acid catalyst in the presence of moisture results in the "reversion" of orthoesters back into a mixture of ester and alcohol. In the instance where the ester alcohol is not the same as the orthoester forming alcohol, and depending upon the structure and reactivity of the orthoester components, one of the alcohols released from the reversion reaction may be the original ester alcohol resulting in one of the "orthoester forming" alcohols now comprising the ester. In this instance, "transesterification" has occurred.

Without wishing to be limited by theory, the release rate of the fragrance raw material alcohol from the cyclic orthoesters of the present invention may be controlled, for example, by adjusting, separately or in combination, either the relative basicity of the orthoester oxygen atoms in the cyclic moiety or the torsional ring strain of the resulting cyclic orthoesters. One result of these adjustments is to provide increased or decreased ring opening kinetics and thereby a means for regulating the release rate of the fragrance raw material alcohol.

Not wishing to be limited by theory, a formulator wishing to increase the degree of torsional strain in the pro-perfume ring may, however, select a diol having two non-terminus alcohols, for example, 2,3-octanediol or 3,4-octanediol. The increase or decrease in the torsional strain of the cyclic pro-perfume ring provides the formulator with a means for adjusting the rate at which the fragrance raw material alcohol is released by the cyclic orthoester. For example, the two cyclic pro-perfumes having the formulae:

will exhibit different release rates of perfume raw material alcohol ROH due in part to the torsional strain provided by the eclipsing interaction of the methyl group with the alkyl chain.

#### Fragrance Delivery System

The present invention further relates to fragrance delivery systems comprising:

- a) at least one cyclic pro-perfume;
- b) optionally one or more pro-perfumes, pro-fragrances, or pro-accords capable of releasing one or more fragrance raw materials, said fragrance raw materials selected from the group consisting of aldehydes, ketones, alcohols, esters, nitriles, nitro compounds, linear, branched and cyclic alkenes, ethers, and mixtures thereof;
- c) optionally one or more fragrance raw materials; and
- d) the balance carriers and adjunct ingredients.

The pro-perfumes, pro-fragrances, or pro-accords which are combinable with the cyclic pro-perfumes of the present invention are preferably the pro-accords. The term "accord" as used herein is defined as "a mixture of two or more 'fragrance raw materials' which are artfully combined to impart a pleasurable scent, odor, essence, or

fragrance characteristic". Therefore a material which is a "pro-accord" is capable of releasing a mixture of fragrance raw materials or a fragrance accord. Non-limiting examples of pro-accords and pro-fragrances include orthoesters, acetals, ketals, orthocarbonates, and the like described herein below.

When formulated into a fragrance delivery system, the cyclic pro-perfumes of the present invention will comprise from about 0.1% to about 99%, preferably from about 1% to about 50% by weight, of said fragrance delivery system.

The fragrance delivery systems of the present invention preferably comprise the pro-accords described herein below. When present, said pro-accords comprise singly or as an admixture from 0.1% to about 99%, preferably from about 1% to about 50% by weight of the fragrance delivery system.

In addition, the fragrance delivery systems of the present invention further comprises carriers, fixatives, and other adjunct ingredients which can be added in any suitable amount or ratio to the cyclic pro-perfumes or the optional pro-accords which comprise the balance of the delivery system. Typical carriers are methanol, ethanol (preferred), iso-propanol, polyethylene glycol, as well as water in some instances. Fixatives serve to lower the volatility of certain top and middle notes in order to extend their contact time on skin. Adjunct ingredients include perfume raw material components which are essential oils and are therefore not a single chemical entity. In addition, the adjunct ingredients may be mixtures of synthetic fragrance raw materials which serve a further purpose in addition to providing a pleasurable odor.

which can continue to hydrolyze and further release two equivalents of one or more fragrance raw material alcohol according to the following scheme:

#### Fragrance Release Half-life

The cyclic pro-perfumes and other pro-accords useful in the fragrance delivery systems of the present invention generally have a delayed release of final fragrance accord in order to achieve the increased fragrance longevity benefits described herein. However, the pro-accords generally also deliver the fragrance accords during a time period useful to the formulator, for example, within a time period desirable to the consumer.

For the purposes of the present invention the pro-accords generally have a "Fragrance Release Half-life" of less than or equal to 12 hours when measured in  $\text{NaH}_2\text{PO}_4$  buffer at pH 2.5 and greater than or equal to 0.1 hour when measured in  $\text{NaH}_2\text{PO}_4$  buffer at pH 5.3. The "Fragrance Release Half-life" is defined herein as follows.

Pro-accords deliver their corresponding mixture of fragrance raw materials or fragrance accords according to the equation:

wherein the accord which is released may be a binary accord or a multiple fragrance raw material accord.

The rate at which the accord is released is defined by the formula:

$$\text{Rate} = k[\text{Pro-accord}]$$

and can be further expressed by the formula:

$$-\frac{d[\text{Pro-accord}]}{dt} = k[\text{Pro-accord}]$$

wherein  $k$  is the release rate constant and  $[\text{Pro-accord}]$  is the concentration of pro-accord. For the purposes of the present invention the "Fragrance Release Half-life",  $t_{1/2}$ , is related to the release rate constant by the formula:

$$t_{1/2} = \frac{0.693}{k}$$

and this relationship is used for the purposes of the present invention to determine the "fragrance Release Half-life" (FRHL).

Due to the hydrophobic nature of some pro-accords, it is necessary to conduct the determination of  $t_{1/2}$  and  $k$  in a mixture of 90/10 dioxane/phosphate buffered water.

An example of the procedure used to measure the suitability of a pro-accord for use in the fragrance delivery systems at pH 2.5 is as follows. The phosphate buffered water is prepared by admixing 3.95 mL of 85% phosphoric acid ( $\text{H}_3\text{PO}_4$ ) and 24 g of sodium dihydrogen phosphate ( $\text{NaH}_2\text{PO}_4$ ) with one liter of water. The pH of this solution is approximately 2.5. Next 10 mL of the phosphate buffer is admixed with 90 mL of dioxane and the pro-fragrance to be analyzed is added. The hydrolysis kinetics are then monitored by conventional HPLC at 30° C.

The pro-accord component of the present invention, in order to assure the stability of acid labile pro-accords, may include a source of reserve alkalinity equivalent to at least 0.001 molar (1 milli-molar) sodium hydroxide. This reserve alkalinity generally serves to prevent premature release of the fragrance raw materials by the pro-accords prior to exposure of the pro-accords to skin. For the purposes of the present invention the term "a reserve alkalinity of at least 0.001 molar" is defined as "the amount of alkaline material present in one liter of the second component when placed in an equivalent volume of water, would produce a hydroxide ion equivalent of 0.001 moles or greater". By way of illustration, 0.0004 g of NaOH present in a 10 mL aliquot of the second component would produce a reserve alkalinity of at least 0.001 molar.

Suitable sources of alkalinity are the alkali metal and alkali earth hydroxides. For example, sodium hydroxide, potassium hydroxide, lithium hydroxide, calcium hydroxide, magnesium hydroxide, sodium carbonate, potassium carbonate, and sodium silicate. However, other suitable sources of alkalinity can be used which are compatible with the pro-accords of the "pro-accord component".

In addition, the fragrance delivery system of the present invention may be suitably use in a fine fragrance composition. Said perfume compositions provide extended fragrance character impressions, and comprise:

- A) a pro-accord component comprising:
  - i) from 0.1% to 99% by weight, of one or more pro-accords formed from at least one fragrance raw material, said pro-accord releasing upon hydrolysis at least two fragrance raw materials selected from the group consisting of primary, secondary, and tertiary alcohols, aldehydes, ketones, esters, carbonates, and mixtures thereof, provided each pro-accord:
    - a) is formed from at least one fragrance raw material having a molecular weight greater than or equal to about 100 g/mol;
    - b) has a molecular weight greater than or equal to about 300 g/mol;

- c) has a molecular weight at least two times greater than the lowest molecular weight fragrance raw material which comprises said pro-accord;
    - d) has a fragrance release half-life of less than or equal to about 12 hours at pH 2.5 or greater than or equal to about 0.1 hour at pH 5.3 when measured in  $\text{NaH}_2\text{PO}_4$  buffer;
  - ii) the balance carriers, stabilizers, and other adjunct ingredients whereby said pro-accord component is provided with an amount of reserve alkalinity equal to at least 0.001 molar  $\text{NaOH}$ ;
- B) a fragrance raw material component comprising:
- i) from 0.1% to about 99% by weight, of a mixture of base note fragrances;
  - ii) from 0.1% to about 99% by weight, of one or more top and middle note fragrances;
  - ii) the balance carriers, fixatives, and other adjunct ingredients; and
- C) from 0.1% to about 99% by weight, of a cyclic pro-perfume component comprising one or more of the cyclic pro-perfumes described herein.

The following are examples of cyclic pro-accords of the present invention which release fragrance raw materials.
